

Project Overview

Centralized Travel Price Comparison System • built entirely in UiPath Studio

1. What this project does

It is a UiPath automation that **compares flight fares and train fares for a chosen journey and reports the cheapest option** - the cheapest flight, the cheapest train, and the cheapest of the two overall. It is designed to run and demonstrate in minutes for a college presentation.

2. How it works (what happens when you run Main.xaml)

- 1 Get inputs** - asks 5 things: Source, Destination, Travel Date, what to search (Flights / Trains / Both), and mode (Demo / Live). These are the first 5 pop-ups.
- 2 Get the data** - loads a list of flights and a list of trains. In DEMO mode it uses built-in **sample data** (not live prices).
- 3 Find cheapest flight** - scans every flight fare and keeps the lowest.
- 4 Find cheapest train** - does the same for trains.
- 5 Compare** - puts the cheapest flight against the cheapest train and works out which is cheaper and by how much.
- 6 Show results** - displays the three outputs (the last 3 pop-ups).

3. The three outputs explained

(Values below are from the built-in sample data, for the journey Chennai to New Delhi.)

OUTPUT 1 - Cheapest Flight

The single flight with the **lowest fare** among all flights.

Example: **SpiceJet (SG-401)**, 18:40 to 21:35, 2h 55m, **Rs. 4499**

OUTPUT 2 - Cheapest Train

The single train with the **lowest fare** among all trains.

Example: **Grand Trunk Express (12615)**, 19:15 to 06:50, 35h 35m, **Rs. 1985**

OUTPUT 3 - Cheapest Overall

Compares Output 1 vs Output 2 and reports the **cheaper mode** and the **money saved**.

Example: Cheaper mode = **Train**, Rs. 1985, **saves Rs. 2514** vs the cheapest flight (4499 - 1985 = 2514).

4. Key points to mention in your demo

- **Cheapest = price only.** It compares on fare, not speed - so the train can win even though the flight is much faster. That is correct for a 'cheapest fare' tool.
- **Handles missing data.** If no flight or no train is found, that output says so and the comparison still works with whatever is available.
- **DEMO vs LIVE.** DEMO (default) uses built-in sample data and always works offline. LIVE is an optional placeholder you can wire up in Studio to a permitted source.

Honesty note: the fares are clearly-labelled **sample / DEMO data - not live prices**. This project does **not** scrape MakeMyTrip or any live website (their terms restrict automated access). It is built so an authorised data source could be added later. See Documentation/MAKEMYTRIP_NOTICE.md.

Made with UiPath Studio (Windows / .NET, VB) • Activities used: Input Dialog, Invoke Workflow File, Assign, If, Sequence, Flowchart, Try Catch.
